Github Repository

Basic Login Challenges in a React Application

- Store credentials and enable user login
- Manage authentication state across different components
- Ensure secure storage of sensitive information
- Process user data efficiently
- Handle session expiration and logout
- Secure all routes and manage redirections effectively
- Manage users and roles with appropriate access control
- Implement standard error handling throughout the application

Application Login

Federated / Social login

User Management

Single sign-on (SSO)

Account locking

Multi factor authentication (MFA)

Password reset

User authorization

Secure API Access

Consent management

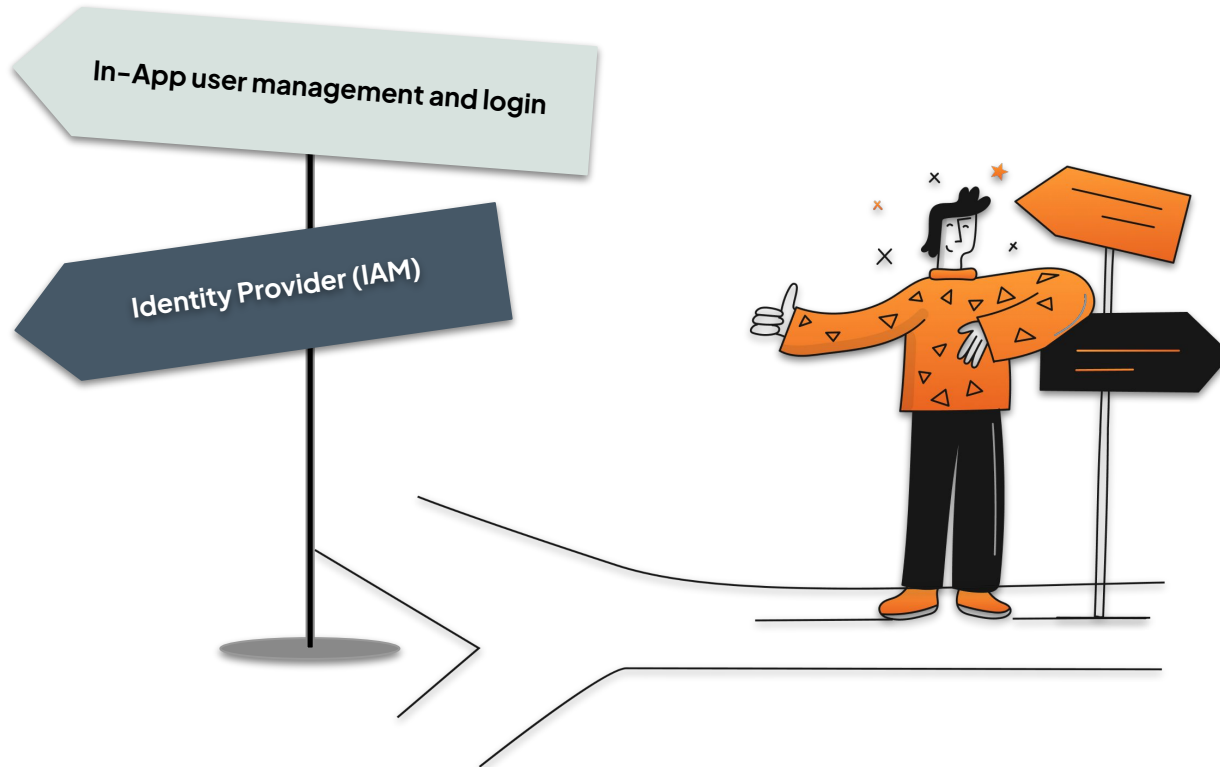

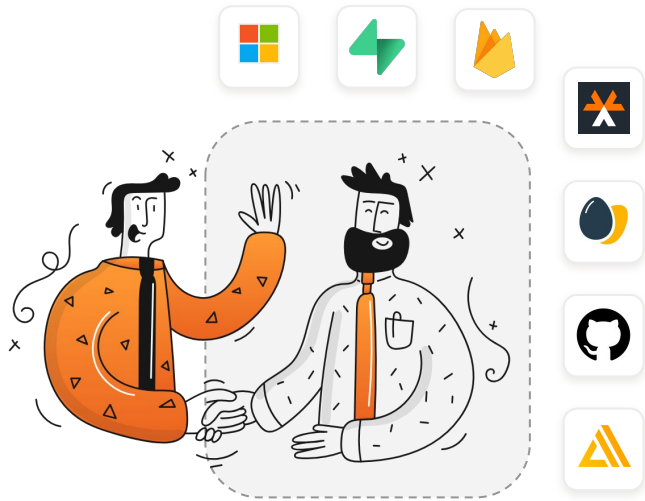

Application insights

Extended capabilities with Login Capabilities

- Single Sign-On (SSO)
- Multi Factor Authentication (MFA),
- Multiple Login Options
- Social Logins, Enterprise IDP Logins, Connect LDAP and Active Directory
- Multi-attribute login
- Passwordless Authentication through Passkeys, SMS OTP, Email OTP and Magic Links
- Conditional Authentication (Based on User Attribute, IP, Risk Level, New Device, etc...)
- User registration, User verifications
- Account recovery, disabling, and suspension features
- Event-based notifications for key actions
- Audit trails and reporting capabilities
- Scalability & Performance
- Regulatory compliance

What is the solution?

**Integrate your app with an
External Identity Provider**

And

**Focus solely on your
business capabilities!**

Identity & Access Management (IAM) Products

Standard Protocol to communicate with identity Providers

Auth2 / OIDC

Auth 2.0 (OAuth2) and OpenID Connect (OIDC) are protocols used for authentication and authorization, often in modern web applications. They allow secure access to resources and provide user identity verification.

SAML

Open standard for exchanging authentication and authorization data between parties, specifically between an identity provider (IdP) and an Application.

Kerberos

Network authentication protocol designed to provide secure authentication for users and services in a computer network, particularly in a client-server environment.

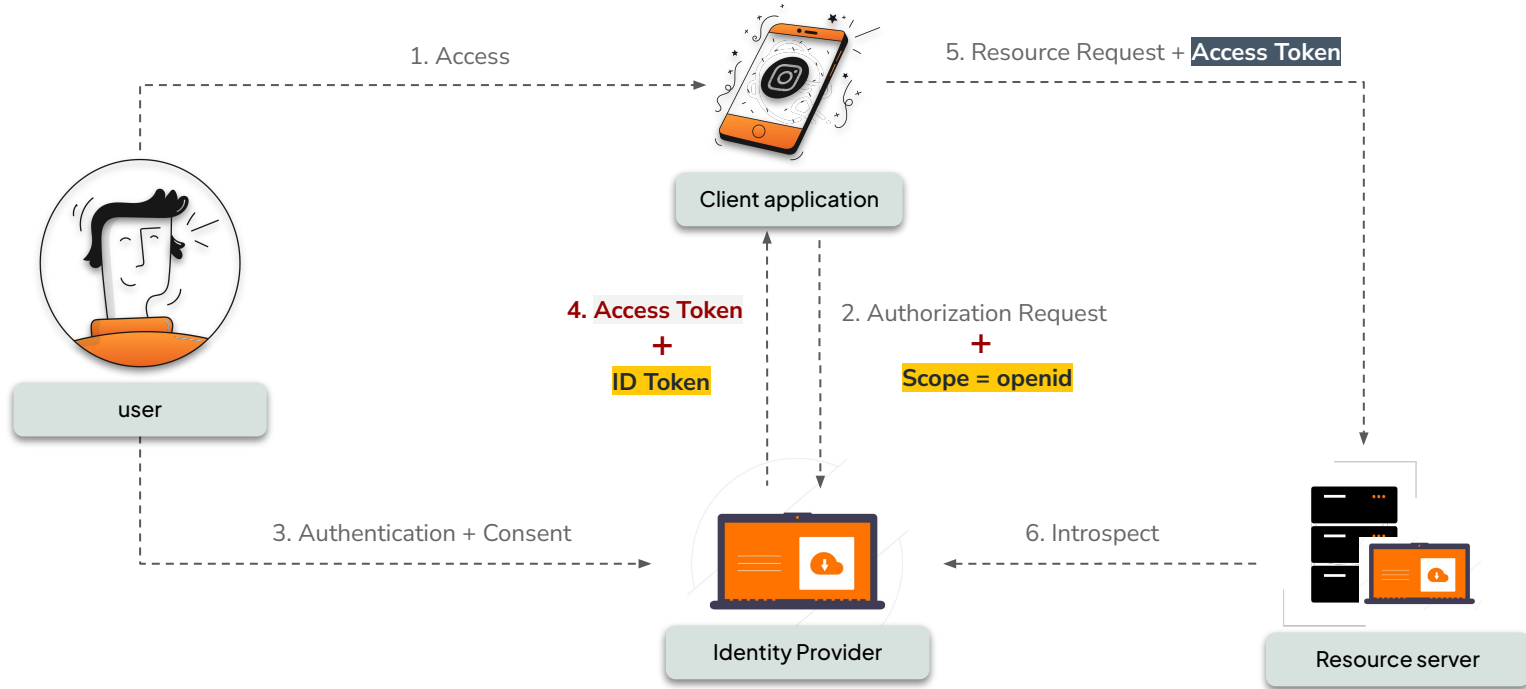

LDAP

Used for authentication by verifying users' credentials stored in an LDAP directory, such as Active Directory (AD) or OpenLDAP.

SCIM2

Open standard designed to simplify the management of user identities in cloud-based applications and services.

User authentication flow with OIDC

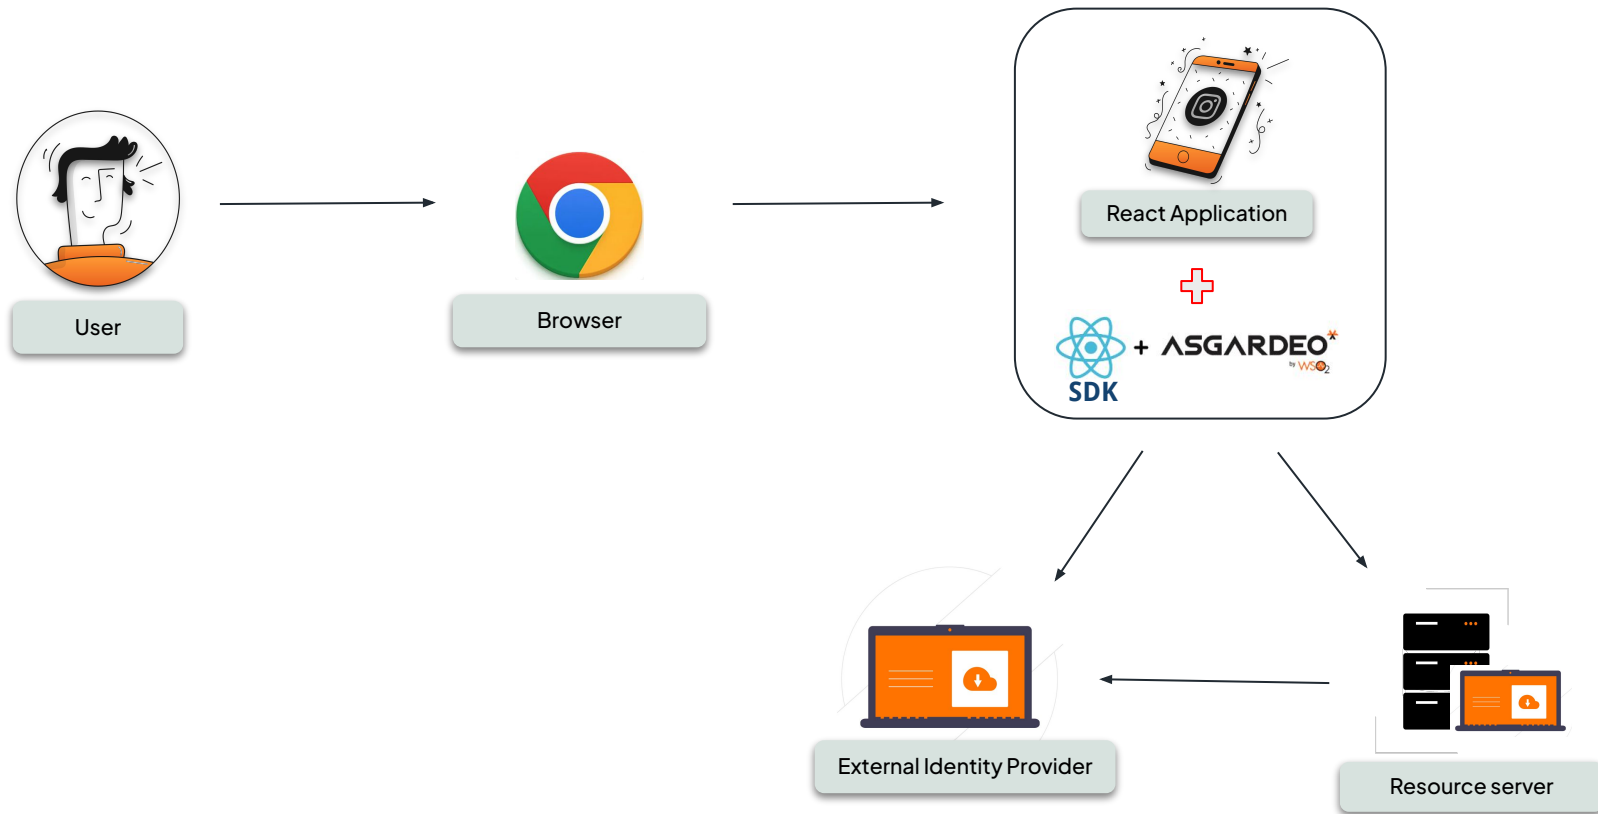

Asgardeo React SDK

ASGARDEO⁺
by VSO₂

Connecting the application with an external identity provider

Let's try this

Hands-On

- Integrate an application with an Identity Provider
 - ◉ Create a React application with Vite
 - ◉ Install React SDK given by Adgardeo
 - ◉ Integrate your React application with Identity Provider
 - ◉ Implement login and logout capabilities
- Demo a sample application
 - ◉ Secure routes
 - ◉ Read user profile (JWT)
 - ◉ Access Secure resources

Hands-on
